

**Presented at the FIG Working Week 2017,
May 29 - June 2, 2017 in Helsinki, Finland**

Indoor Navigation and the Conferest Demo App

Dept. of Navigation and Positioning
Finnish Geospatial Research Institute
National Land Survey of Finland

The Finnish Geospatial Research Institute

- Governmental research institute
 - About 120 staff
(roughly 80 scientists)
 - Budget roughly 10 MEUR
(mostly outside financed)
 - Highly academic institute
(nearly 50% staff has PhD
and 20% are international)
- 
- Publish around 80 ISI Web of Science peer reviewed articles annually
(150 peer reviewed scientific publications)
 - Joint professorships with universities

Department of Navigation and Positioning

- Current staff: 23, with 9 PhDs
- Three research groups:
 - [Satellite and Radio Navigation \(SaRaNa\)](#)
 - [Sensors and Indoor Navigation \(SINa\)](#)
 - [Intelligent Mobility and Geospatial Computing \(IMGC\)](#)
- A navigation laboratory with state-of-the-art equipment (signal simulators, roof antennas, repeaters, receivers and sensors)

Navilab

Expertise areas of the Department

Satellite navigation

- GPS, GLONASS, BeiDou, Galileo, IRNSS
- SBAS systems, especially EGNOS
- Interference detection and mitigation
- Software-defined GNSS receivers
- PPP & RTK

Indoor navigation

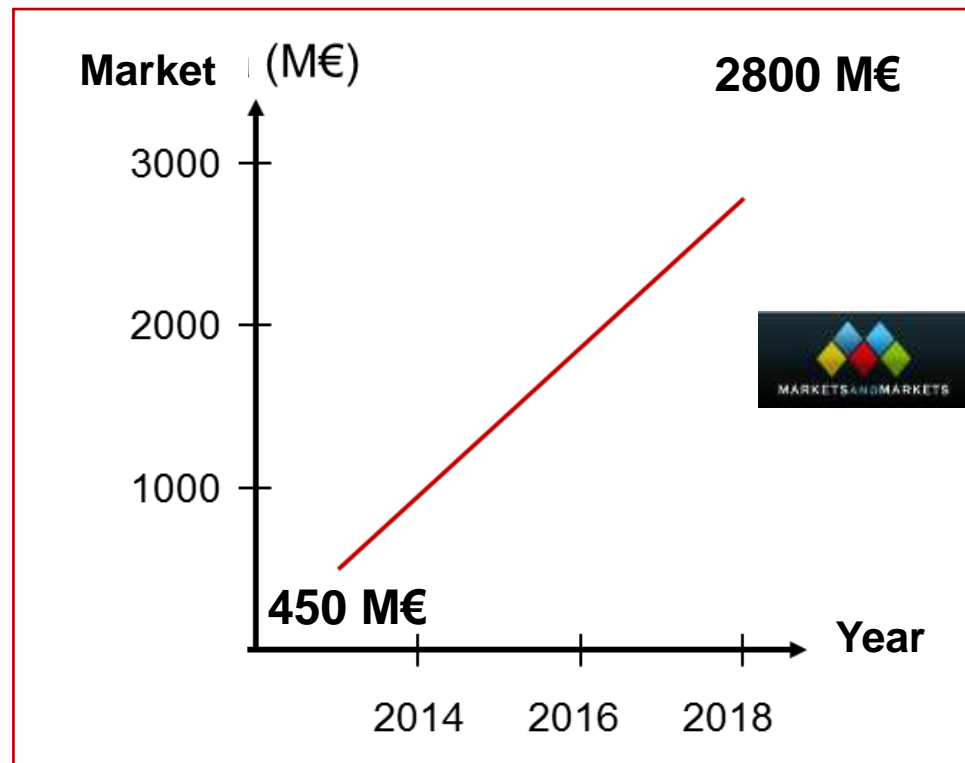

- Sensor integration
- Indoor positioning
- Visual and DTV positioning
- Optical sensors

LBS and contextual thinking

- Motion recognition, context awareness
- Positioning in intelligent transportation systems
- Positioning for maritime

Why do we need indoor navigation?

- People spend 90% of their time indoors
(<https://indoor.lbl.gov/sites/all/files/lbni-47713.pdf>)
- Consumers need navigation in
 - Conferences, malls, hospitals, parking halls...
- Location based services

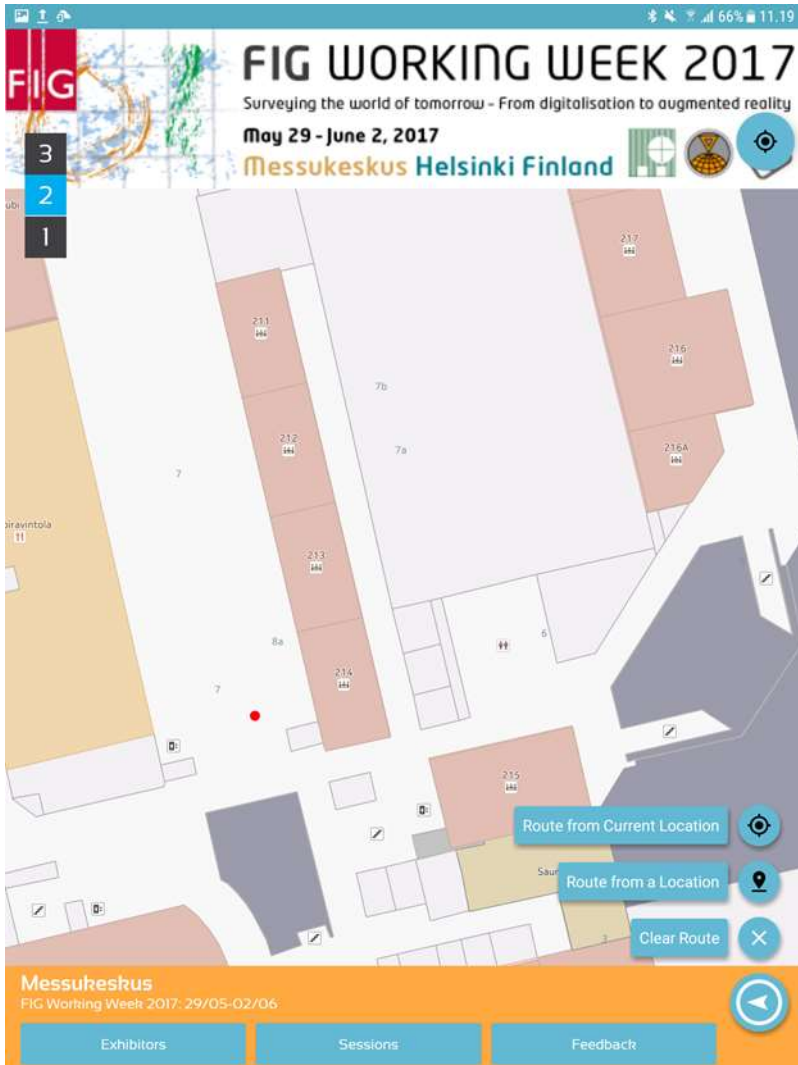

Challenges in indoor navigation

- Satellite-based positioning is not always feasible indoors.
 - Signals attenuate while they travel through constructions
 - Signals experience multipath when reflecting/scattering off constructions

The resulting position solution is degraded or not available at all

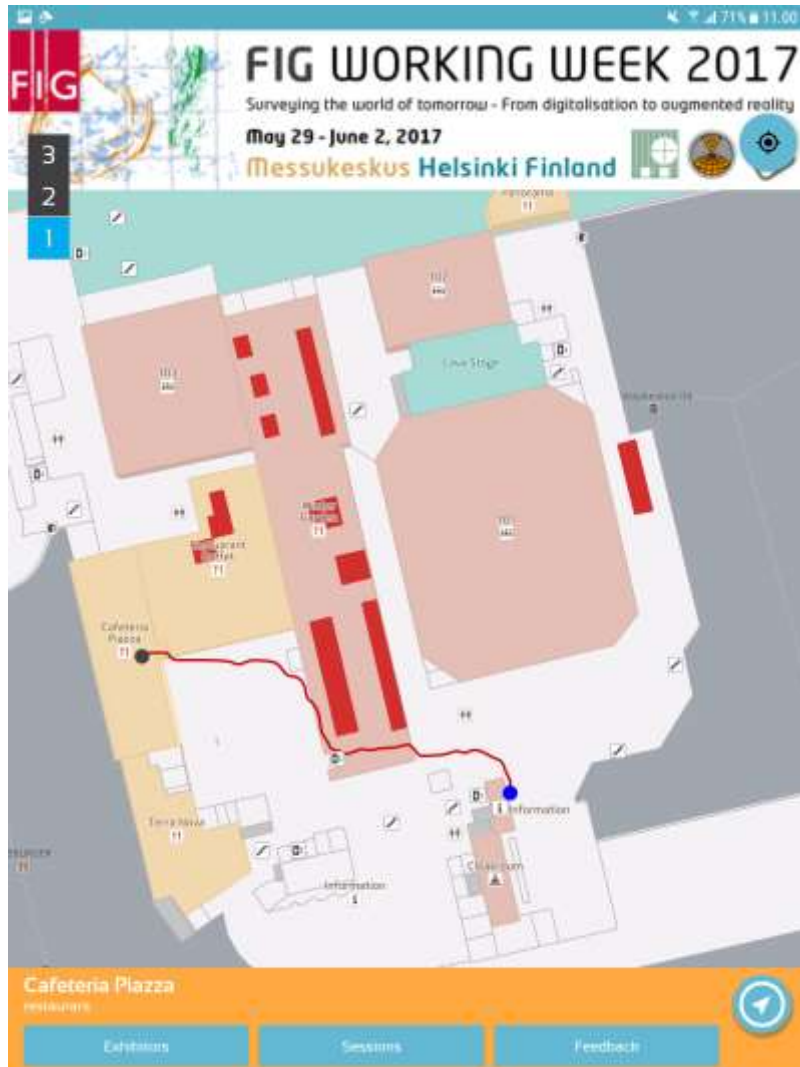

Conferest application at FIGWW2017

- Positioning everywhere within the conference premises
- Based on HERE's indoor positioning system using WLAN signals
- Routing for the exhibitor area developed by FGI
- Works only for Android due to Apple's decision not to open the WLAN measurements via any public API

Conferest layout and routing

- The exhibitor booths are laid over the HERE Venue map
- Routing is based on the Lee algorithm
 - Lee, C.Y., "An Algorithm for Path Connections and Its Applications", IRE Transactions on Electronic Computers, vol. EC-10, number 2, pp. 364-365, 1961

Lee's routing algorithm

- Lee's algorithm is one solution to the Maze routing problem
- Routing surface is represented by a 2D array
- Finds a sequence of adjacent cells from point A (user's location) to point B (desired destination)
- If a path exists, it is eventually found:
 - The algorithm ensures the selected route is the shortest.
 - In practice, however, there might be some implementation challenges due to the booth overlaying on the venue map
 - Time and memory complexities $O(N^2)$ for a $N \times N$ grid
 - Performs well in a restricted area, but can suffer in larger areas.

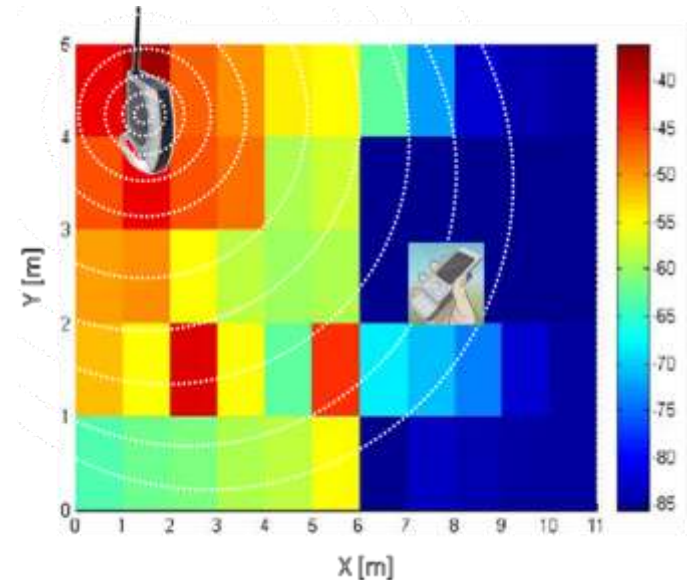

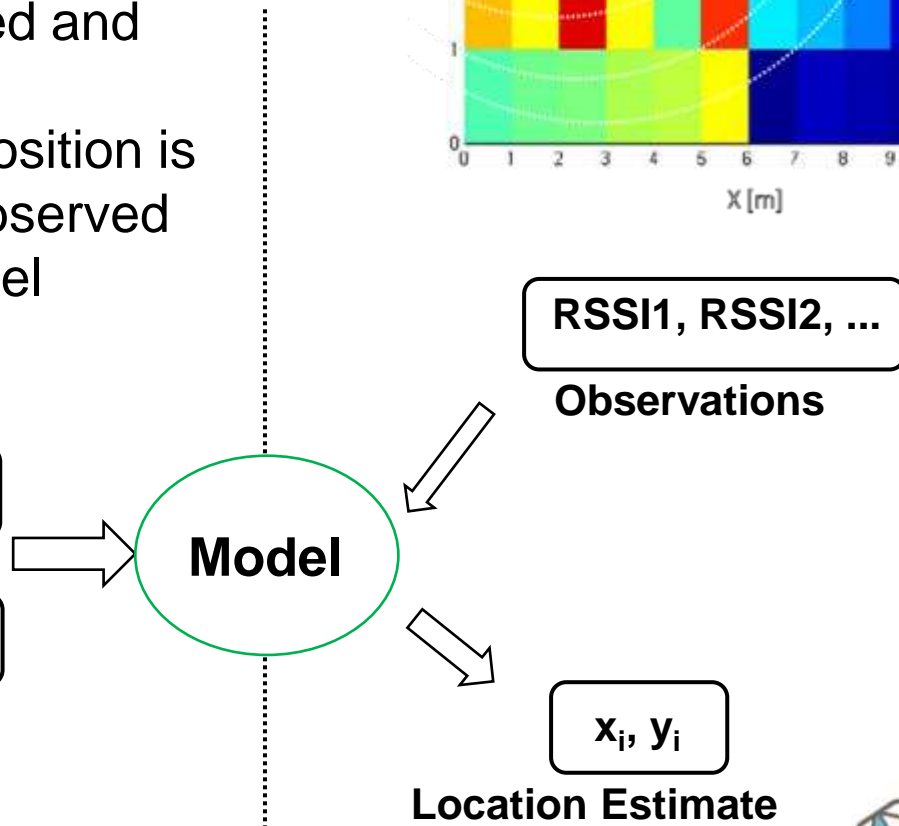

FIGWW2017's grid

WLAN positioning

Two phases:

- Training phase: The prevailing signal environment mapped and modeled
- Positioning phase: User position is estimated based on the observed signals and using the model

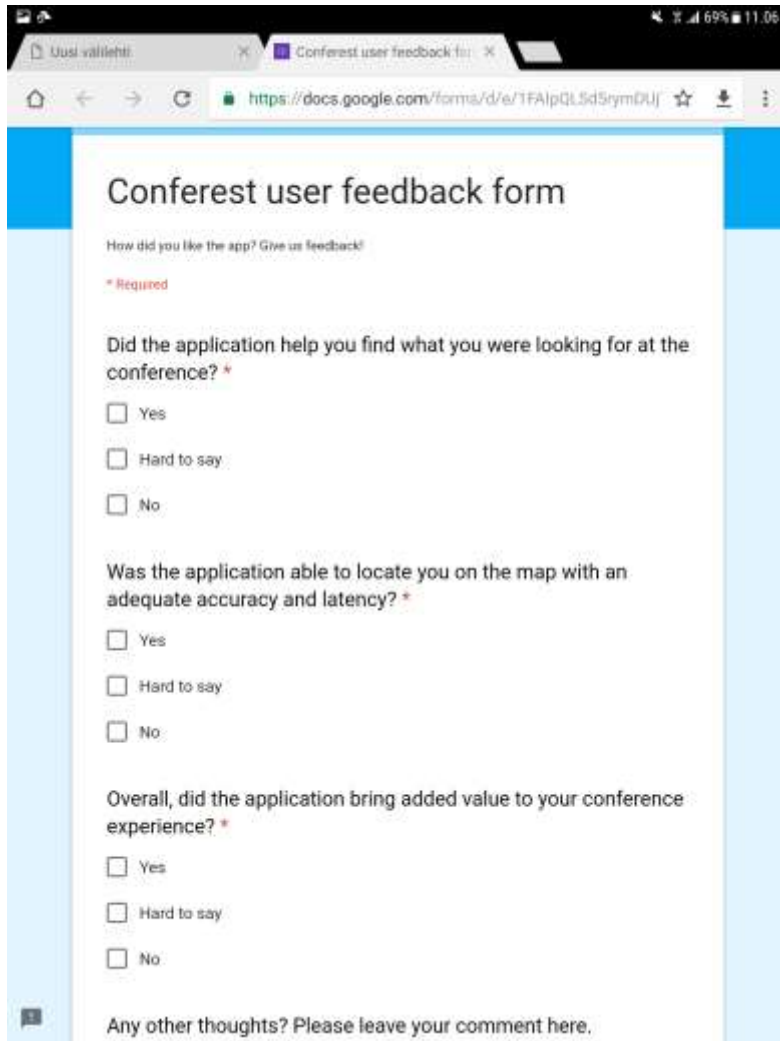

HERE's positioning system

- HERE's positioning system is robust despite:
 - minor infrastructure changes (e.g. moving radio beacons) and
 - people moving in the environment
- Accuracy 3-5 meters
- Functions also with Bluetooth beacons
 - With beacons, Apple devices can be used also
 - Accuracy 2-3 meters

Give your feedback

The screenshot shows a mobile browser interface displaying a Google Forms survey. The browser's address bar shows the URL: <https://docs.google.com/forms/d/e/1FAIpQL5d5ymDUJ>. The survey title is "Conferest user feedback form". Below the title, there is a sub-header: "How did you like the app? Give us feedback!". A red asterisk indicates that the following question is required. The first question is: "Did the application help you find what you were looking for at the conference? *". It has three radio button options: "Yes", "Hard to say", and "No". The second question is: "Was the application able to locate you on the map with an adequate accuracy and latency? *". It also has three radio button options: "Yes", "Hard to say", and "No". The third question is: "Overall, did the application bring added value to your conference experience? *". It has three radio button options: "Yes", "Hard to say", and "No". At the bottom of the form, there is a text input field with the placeholder text: "Any other thoughts? Please leave your comment here."

- Please let us know what you think of the application and fill the feedback form
 - sed for further research
