- In shaping the structure of housing market, several theories have been proposed, aiming at discussing the relationship between location and physical quality of houses as in ([Alonso, 1964](#); [Fujita, 1989](#); [Kim, Pagliara, & Preston, 2005](#); [Smith, 1987](#))
- ([Huu Phe & Wakely, 2000](#)) explained the dynamics of urban transformation and development, or in particular the dynamics of choice of residential houses (Status Quality Trade Off - SQTO) theory to house prices

## Study area & Data

# FIG WORKING WEEK 2017

Surveying the world of tomorrow -

Helsinki Finland 29 May - 2 June 2017

From digitalisation to augmented reality

Hedonic regression and geographically weighted regression are two common approaches in dealing with spatial data and with house prices in particular as in works of ([Gollini, Lu, Charlton, Brunson, & Harris, 2015](#); [Lu, Harris, Charlton, & Brunson, 2014](#)) ([Chen, Clapp, & Tirtiroglu, 2011](#); [Dorsey, Hu, Mayer, & Wang, 2010](#); [Liao & Wang, 2012](#); [Selim, 2009](#))

Recent researches have proved non-linear machine learning and the use of fuzzy logics ([Kuşan, AYTEKIN, & ÖZDEMİR, 2010](#)) can be a suitable solution to predict the variation of house prices. ([Chiarazzo, Caggiani, Marinelli, & Ottomanelli, 2014](#); [Steven P. Peterson, 2009](#); [Vo et al., 2014](#); [Wong, So, & Hung, 2002](#))

Dependent variable	Description	Data type
<b>HPRICVND</b>	Price of house in Millions of Vietnamese Dong	Ratio
<b>Tangible Independent variables</b>	Description	
<b>AIRCON</b>	Air-Conditioner (Yes, No)	Nominal
<b>GFA</b>	Total floor area (incl. mezzanine) (m <sup>2</sup> )	Ratio
<b>PLOTAREA</b>	Total plot area (m <sup>2</sup> )	Ratio
<b>SHOPFRNT</b>	Shop Front (Yes, No)	Nominal
<b>PLUMBING</b>	Plumbing Quality (Good, Other)	Nominal
<b>HOUSEGRADE</b>	Permanent, Other	Nominal
<b>Intangible Independent variables</b>	Description	
<b>CAR</b>	Car ownership (Yes, No)	Nominal
<b>CENTDISR</b>	Measured distance to Centre District	Ratio
<b>DISCENDI</b>	Perceived travel time to the Centre District	Ratio
<b>EDYEARS</b>	Time in education of the interviewee (years)	Ratio
<b>OCCUP_PRIVBIZ</b>	Private Business owner (1=Yes, 0=No)	Nominal
<b>SCHOOQLT</b>	School Quality (Good, Other)	Nominal

From digitalisation to augmented reality

## Methodology

### Artificial Neural Network

### Performance assessment

Root Mean Square Error (RMSE) and Mean Absolute Error (MAE) were often used to evaluate the performance of house price prediction models ([Park & Bae, 2015](#); [Wu, Gyourko, & Deng, 2012](#))

### Support Vector Machine

$$\text{Objective Function: } \min_{w, b, \xi_i} \left\{ \frac{\|w\|^2}{2} + C \sum_{i=1}^n (\xi_i)^k \right\}$$

$$\text{Linear Constraints: } y_i (w^T x_i + b) \geq 1 - \xi_i, \quad \forall x_i \in D$$
$$\xi_i \geq 0 \quad \forall x_i \in D$$

2) the West Lake area (Hồ Tây): The West Lake area (Hồ Tây) is emerging as the most important food, fashion and creative quarter of Hanoi City

3) the South West area (around Trung Hoa Nhan Chinh New Urban Area): The area was deliberately targeting the yuppies group

1) the Restored Sword Lake area (Hồ Gươm): The role of the Restored Sword area (Hồ Gươm) as the most important city centre, is a historical fact, widely recognised

SQTO theory can fully be used to explain the structure of urban residents.

In addition to the systematic prediction for the presence of different poles in Hanoi, the estimation of hidden (implicit) value of tangible and intangible attributes based on data mining algorithm has proved to be very useful in identifying the driving forces of house price formation across the market segments.

The result also describes a strong movement of city structure from uni-polar to multiple-polar structure and it can be considered as preliminary foundation for a urban decision support system.
