## The Nation Land Capacity Building Model for Informatization

– an ICT based model to strengthen human resource capacity for the sustainability of land administration modernization projects

Beckhee Cho, LX Korea Land & Geospatial Informatix Corp

## What is Capacity Building?

“ the ability of people, organization, and society as whole to manage their affairs successfully.” (OECD/DAC 2006)

“ the ability of individuals and organization and organizational units to perform functions effectively, efficiently, and sustainably.” (UNDP, 1998).

“ ... (i) capacity is not a passive state but is part of a continuing process; (ii) it ensures that human resources and the way in which they are utilized are central to capacity development; and (iii) it requires that the overall context within which organizations undertake their functions will also be a key consideration in strategies for capacity development.” (“Capacity Building in Land Administration – A Conceptual Approach” by Enemark and Williamson 2004)

## Increased demand of global "Land Informatization"

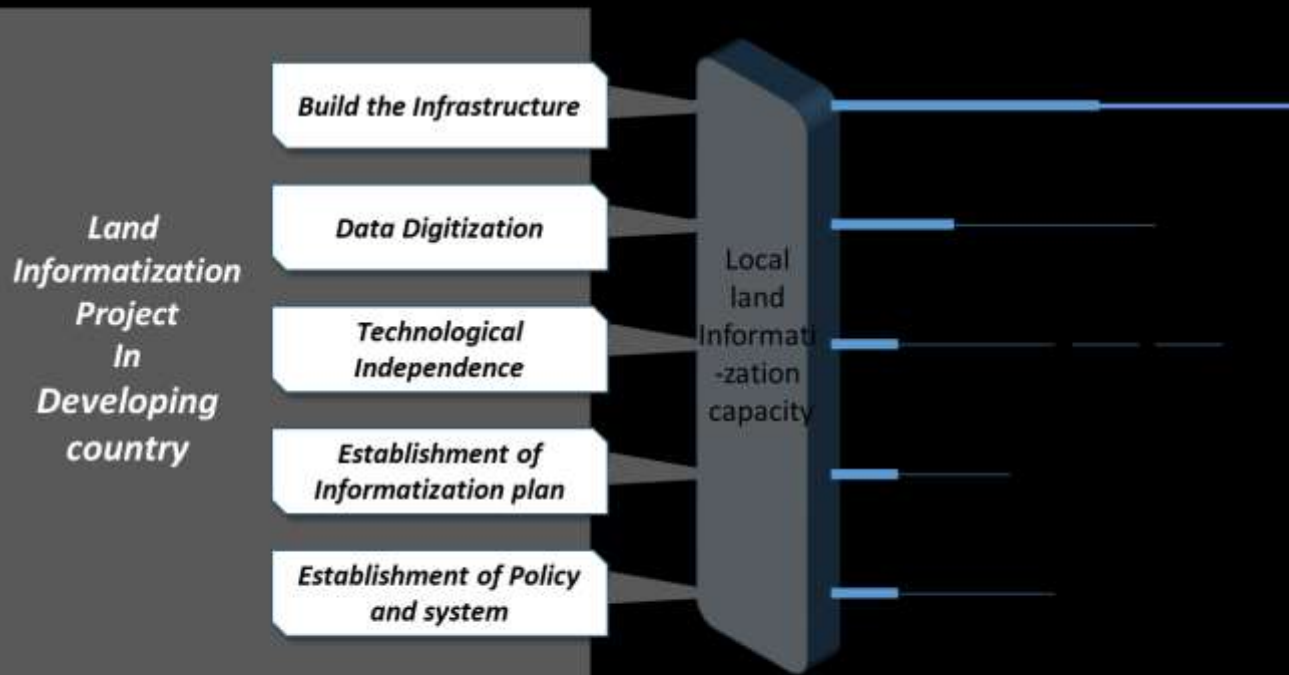

*"Importance of informatization has been increased in national land area"*

6-11 May 2018 ISTANBUL

**Land Information Governance**

**Check list for the National Land Information Capacity Diagnosis**

**Interviewees: (name of institute)**

Structure of diagnosis and assessment tool:

- Component: Major components that form each view
- Sub-Component: Segmentalized indicators to identify whether the recipient country satisfies related qualifications of the component
- Indicator: Basic qualifications which the country or organization has to satisfy in that structure phase
- Questions: Queries for the experts about whether the recipient country satisfies the sub-indicator
- Answers: Possible answer choices when asked a question
- Evaluation Method: Method to calculate the score
- Scoring rate: Scoring rates are weighted so that there is a distinction in scores according to which answer was chosen

Indicators for Diagnosis Level 2 (Digitization): The country/organization should satisfy indicators below if it is on the documentation level of land information.

G2180 (Rights to access land information) Citizens: Land information includes not only the rights to access land information.

G2181: The rights to access land information

Q1: Is it officially allowed for citizens to access land information?

- a. The recipient Land information is not available, but there are no laws and regulations that prohibit it.
- b. It is possible to access and use the recipient Land information.

**Land Information Infrastructure <Data>**

**Check list for the National Land Information Capacity Diagnosis**

**Interviewees: (name of institute)**

Structure of diagnosis and assessment tool:

- Component: Major components that form each view
- Sub-Component: Segmentalized indicators to identify whether the recipient country satisfies related qualifications of the component
- Indicator: Basic qualifications which the country or organization has to satisfy in that structure phase
- Questions: Queries for the experts about whether the recipient country satisfies the sub-indicator
- Answers: Possible answer choices when asked a question
- Evaluation Method: Method to calculate the score
- Scoring rate: Scoring rates are weighted so that there is a distinction in scores according to which answer was chosen

Indicators for Diagnosis Level 1 (Documentation)

<There are no questions in Level 1, because information system does not exist in documentation level.>

Indicator for Diagnosis Level 2 (Digitization): The country/organization should satisfy indicators below if it is on the documentation level of land information.

S2180 (Introduction of digital recording system) There should be a system that records land-related work and major documents into digital information.

- 1) Component: Major components that form each perspective
- 2) sub-Component: Segmentalized indicator for practically verifying whether the current status of the recipient country satisfies each level of the component
- 3) Indicator: A standard indicator for diagnosing which of five levels the recipient country stand in
- 4) Question: Questions for the experts of the recipient country to verify the sub-Indicator
- 5) Answer: Different answers to choose from when given the questions
- 6) Evaluation Method: Method to calculate evaluation score of each questions according to the chose answers
- 7) Scoring rate: Weighted the scoring rate so that there is a distinction in scores according to which answer was chosen

**EMBRACING OUR SMART WORLD WHERE THE CONTINENTS CONNECT:**

**ENHANCING THE GEOSPATIAL MATURITY OF SOCIETIES**

## Key Assessment

- 1 The basic right to access land information is guaranteed
- 2 Land information is not standardized
- 3 Administration of land information is conducted under legally defined roles and responsibilities
- 4 Lack of clearly defined legal framework pertaining to usage of digital land information
- 5 Preparation for utilizing spatial information is inadequate

## Key Issue

- 1 **[Category for Basic Land Use]**  
Land use category is not clearly defined by law. And also, the role to register the category is not clear among ministries
- 2 **[Category of Land Taxation]**  
There is no taxation on land. Only local tax exist in municipality
- 3 **[Standardization of Land Measure]**  
OTC recommends land measure system for land survey. But many surveyors still don't follow the system
- 4 **[Digitized Land Information Use]**  
There is no law and policy on usage and sharing of digitized Land information

ORGANISED BY

MAIN SUPPORTERS

PLATINUM SPONSORS

**6-11 May 2018 ISTANBUL**

**EMBRACING OUR SMART WORLD WHERE THE CONTINENTS CONNECT:**

**ENHANCING THE GEOSPATIAL MATURITY OF SOCIETIES**

## Key Assessment

- 1 Land information is managed in paper-based format, and land transactions are conducted with government validated paper-based document
- 2 Map production taking place independently with agencies often focus only on their short-term objectives. As a result, quality of maps are substandard and updates are not performed regularly
- 3 Land information is coded with identifiers in order to link information between organizations. Nevertheless, there are difficulties in linking use of information between organizations due to varying levels of sophistication among them
- 4 The environment is not fully developed to produce and manage digital land information
- 5 A new registration request is estimated to take at least nine months to complete

## Key Issue

- 1 **[Accuracy of registered land information]**  
There is no belief on the accuracy of land survey results. Because, in case of private company's land survey, there is no review process to check their results.
- 2 **[Land Information Digitalization]**  
50% of OTC data is managed as analog
- 3 **[Digitalization of Land administration]**  
Most administrative proceedings and reports are process by hand
- 4 **[Data integration & Update]**  
Because of lack integration between other agencies, headquarters and branch offices, there is a difficulty of integration and update

PLATINUM SPONSORS

6-11 May 2018 ISTANBUL

EMBRACING OUR SMART WORLD WHERE THE CONTINENTS CONNECT:

ENHANCING THE GEOSPATIAL MATURITY OF SOCIETIES

## Key Assessment Check List

- 1 Tunisia operates a software application developed in-house that supports administrative tasks related to recording and managing land attributes information, and to register land, as well as certificate issuance
- 2 Even though cadastral maps are produced using Auto CAD, there is no single system that records and manages those cadastral maps
- 3 There is no integrated land information system that links access to and usage of major land information such as land attributes, cadastral maps, topography, etc

## Key Issue

- 1 **[Digital mapping]**  
Most surveyors use CAD for drawing cadastral plan, but they are lack of capacity to develop the digital seamless map. There is only digital seamless map for small area through a pilot project.
- 2 **[Information system for land administration]**  
There is tailored information system for reception and registration in CPF. But this system can not support full process for land administration.
- 3 **[Geographic cadastral information system]**  
There is no information system which is operated based on geographic data, and no information system for supporting land surveying, mapping, and land data processing

ORGANISED BY

MAIN SUPPORTERS

PLATINUM SPONSORS

**6-11 May 2018 ISTANBUL**

**EMBRACING OUR SMART WORLD WHERE THE CONTINENTS CONNECT:**

**ENHANCING THE GEOSPATIAL MATURITY OF SOCIETIES**

## Key Assessment Check List

- 1 Land surveys are conducted using modern surveying equipment including GPS
- 2 Even though cadastral maps are produced using Auto CAD, there is no single system that records and manages those cadastral maps
- 3 There is no integrated land information system that links access to and usage of major land information such as land attributes, cadastral maps, topography, etc.

## Key Issue

- 1 **[Utilization of aerial/satellite images]**  
OTC is difficult to acquire its own aerial/satellite images, but CNCT uses aerial/satellite images
- 2 **[Distribution of PC for land administration]**  
TI has a significantly lower PC distribution rate, but OTC and CPF have a high distribution rate of PCs.
- 3 **[Institutional data integration infrastructure]**  
There is no data center for the integrated management of data within the OTC organization, and there is no network for data linkage between headquarters and branch offices.

**EMBRACING OUR SMART WORLD WHERE THE CONTINENTS CONNECT:**

**ENHANCING THE GEOSPATIAL MATURITY OF SOCIETIES**

## Key Assessment Check List

- 1 Total stations are actively used to conduct cadastral surveys
- 2 CAD technology is available to all OTC surveyors
- 3 Geodetic Control Point (GCP) are well distributed across regions and 23 GNSS CORS are installed and fully operational
- 4 The technology to create Cadastral maps by processing aerial and satellite images is substandard
- 5 Only about 15 percent of OTC's cadastral and land diagram records are maintained in scanned form
- 6 Shortage of ge-oreferencing experts to perform coordinate conversion

## Key Issue

- 1 **[Analog data digitization]**  
Vectorizing is in progress, but most of the drawing data is simply scanned and archived / archived data is also simply scanned and archived
- 2 **[Utilization of aerial image and satellite imagery]**  
Lack of equipment makes it difficult to acquire aerial and satellite imagery and lacks image processing capability
- 3 **[GNSS CORS]**  
There are 23 CORS, but lacks operational and management capabilities and no training courses for installation / operation

**EMBRACING OUR SMART WORLD WHERE THE CONTINENTS CONNECT:**

**ENHANCING THE GEOSPATIAL MATURITY OF SOCIETIES**

## Key Assessment Check List

- 1 More than 90 percent of the working documents follow a standard format
- 2 Land documents are managed under separate process explicitly dedicated to update and maintain documents
- 3 PCs are utilized to input and save land data
- 4 Data architecture and standardization have not been implemented
- 5 No specialized personnel trained in DMBS
- 6 A comprehensive data base system has not been established

## Key Issue

- 1 **[Data architecture/ standardization]**  
Knowledge of data architecture absent and capacity is deficient
- 2 **[Data architecture]**  
Knowledge of data architecture absent and capacity is deficient
- 3 **[Build-up Maintenance]**  
Data maintenance level limited to scanning / enhancement is necessity

EMBRACING OUR SMART WORLD WHERE THE CONTINENTS CONNECT:

ENHANCING THE GEOSPATIAL MATURITY OF SOCIETIES

## Key Assessment Check List

- 1 Operational procedures and functional standards are defined
- 2 Use of GIS to perform administrative functions
- 3 Endowed with basic PC skills
- 4 Deficient knowledge of system architecture and standardization planning
- 5 Most organizations do not have an operational land information system
- 6 Most organizations do not have an IT room

## Key Issue

- 1 **[System Architecture/Standardization]**  
Lack of Architecture and Standardization knowledge / need for standardization
- 2 **[GIS S/W utilization]**  
GIS S / W is used for specific tasks but lacks knowledge about software tools
- 3 **[PC and Data Management]**  
Organizations that need to use PCs have a high penetration rate of PCs but not all organizations are not managed due to lack of dedicated IT department
- 4 **[Data Server Management]**  
There are data server, but lacks maintenance and operation capabilities

Assessment Result		Assessment Items for Priority		Strategic Importance		
				Average		
				Tunisia	Korea	
Governance	G01	It reflects the opinion of the Tunisian expert who understands the situation of the present Tunisia.		5.0	5.0	
	G02			5.0	5.0	
	G03			Land information system and land informatization plan should be established from the long-term perspective of spatial information convergence and integration	4.6	3.0
Data	D01	Since the data is in a state of insufficient data, it is determined that data acquisition is the priority and a low score is assigned. However, it is reasonable to maintain the opinions of the existing Korean experts considering the national level.		3.0	4.0	
	D02			3.0	4.0	
	D03			To link and update the data, the land information data of the major agencies and their relationship should be structured and managed	3.0	4.0
System	S01	Due to the use of low-resolution orthographic and aerial photographs, there are some problems such as land disputes. Therefore, the reliability of orthographic and aerial photographs is low, and they are not urgently required at present.		3.3	3.3	
	S02			maps and related land information.	3.0	4.0
	S03			Ortho-photo applications should be introduced for mapping	2.2	3.7
Equipment	E01	Securing data is more important than network construction. It is true that the network should be established for sharing, managing, utilizing, and securing the collected data after the data is collected to some extent, but the importance is low, now.		3.3	4.7	
	E02			PC and digitization/surveying equipment should be additionally supplied for computerization of land information.	3.3	4.7
	E03			Facilities and networks are needed for data integration management within main organizations.	2.9	4.3

Assesment 1-1. Standardization for construction of land information database and system should precede.

Assesment 1-2. The legal basis for ensuring the scope and use rights of digitized land information should be secured

Assesment 2-1. Systems and procedures must be established to produce and manage accurate land information.

Assesment 2-2. An information system based on geographical information should be established to manage cadastral maps and related land information.

Assesment 2-3. Train personnel to maintain and manage land information systems

Assesment 2-4. Strengthen capacity to utilize digitized land information

Assesment 3-1. Land information system and land informatization plan should be established from the long-term perspective of spatial information convergence and integration

## Stage 1. Enhancing land Informatization capacity

- 1) Securing legal basis for ensuring the scope and use rights of digitized land information
- 2) Training of land information system maintenance and management personnel
- 3) Strengthening land information utilization capacity

## Stage2. Land information digitization

- 4) Establishment of procedures and procedures for land information production and management
- 5) Digitized land information and land administration

## Stage 3. Building the land information system

- 6) Design and construction of land information system based on GIS
- 7) Establishment of national land information data architecture
- 8) Establishment of facility and network for data integration management

			Mapping	Field surveying and digitalization				
Organizational Area	Field survey and Data acquisition	Field and Control points Surveying	Mapping Methodology of Field survey (14)	TS Survey (21)	Understanding Image processing(7h) Image processing/R/3S(14) Image processing/Aerial(14)	Understanding GNSS Surveying(7) GNSS Surveying/Static, RTK, VRS(28)	3D surveying / real-time (21)	
		Data Digitalization	Mapping Control point and coordinate (7)	Control points and its management (21)	Coordinate system/conversion(7) Coordinate system/practical(14)	CORS construction & installation(7) CORS operation & management(14)	Innovation of control point management (14)	
	Database construction and management System	Architecture and Data standardization	Mapping (14) (Methodology)	Map and document digitalization (14)	Understanding Geo-referencing(7) Geo-referencing/geo-coding(14)	Data importing and editing(28)	Methodology / Real time data acquisition / Link of Data (14)	
		DBMS and construction of DB	Documentation (7)	Data Standardization (Data modeling)(21) Data Standardization(International standard)(14)	Design of database (planning, design) (14) Construction, maintenance and test	National Standardization policy (21) (policy, e-government)	Development of Open source DBMS (35)	
	System development and operation	Architecture and standardization		Understanding DBMS(14)	PC-based S/W Application(21)	Data mining and warehouse(21)	Data integration and NSDI( 21)	BigData Analysis Technology(14)
		GIS/LIS System development and S/W	BPM(14)	Understanding Spatial Database (theory included)(14)	DBMS Software training (35)	System Architecture Design(35)	Enterprise Architecture (35) (governance, service)	Architecture Asset Frame (21)
		Data center and system operation		Understanding System Architecture(14)	Understanding GIS S/W(7)	Implementation /use of open source GIS(7) Open source GIS S/W Training(21)	Technology of WEB - Mobile GIS (21)	Development of BIG data application system (21)
	Basic	Basic course	Basic training(21h)	Land Administration 1. Land Administration(2h) 2. Introduction of NSDI(2h) 3. Data Sharing and Conversion(2h) 4. Land register(parcel based, deed, multi-purpose)(1h)	LIS development 1(7) LIS development 2(35) Unified Modeling Language (UML - Java source)(35)	LIS Bask 1. Understanding LIS(3h) 2. LIS advanced cases(2h) 3. LIS project(2h)	LIS integration system development (49)	Development of AI application system (21)
		Decision maker	Policy & Cases	1. LIS policy (7h) 2. LIS Project development (2h) 3. LIS/GIS system and advanced cases (2h) 4. Introduction of NSDI (1h) 5. Study cases in advanced country (Korea) (6 days)	System O&M(basic)(21) System O&M(advanced)(49)	Data center O&M (49) (ECMS)	Open Platform O&M (28)	Technician
								Decision Maker
